1. Problem Statement

Nowadays, people are busy with their daily activities and may not have enough time to visit restaurants to buy food. An Online Food Order Website allows customers to view food items and prices, choose their favourite dishes, and calculate the total cost in one place. This project demonstrates a simple online ordering process and makes food selection convenient.

2. Objectives

• Make food ordering simple and convenient.

• Display food items with names and prices.

• Allow users to add selected items to a cart.

• Calculate and display the total cost.

• Provide a clear, user-friendly interface.

• Show an order confirmation message after the user places an order.

3. Architecture

The website uses HTML for structure, CSS for design, and JavaScript for interactive behaviour. The user opens the website, browses the menu, adds items to the cart, checks the total amount, and presses Place Order. This is a front-end demonstration; it does not contact a restaurant or process real payments.

Open Website → **View Food Menu** → **Add to Cart** → **Calculate Total** → **Place Order** → **Confirmation**

4. Practical Implementation

The website is built with three files: index.html, style.css, and script.js. HTML creates the food cards and cart area. CSS styles the page. JavaScript handles adding and removing items, updating the item count, calculating the total, and displaying order messages.

4.1 Features Implemented

Food Menu: Displays Cheese Pizza, Classic Burger, Masala Dosa, and Veg Fried Rice with prices.

Add to Cart: Adds a selected food item to the shopping cart. Adding the same item again increases its quantity.

Total Calculation: Calculates the cost of every selected item and updates the total amount.

Remove Item: Allows users to remove a food item from the cart.

Order Confirmation: Displays a confirmation message when the user places a non-empty demo order.

Responsive Design: Adjusts the menu layout for mobile and desktop screens.

4.2 Source Code

HTML

HTML (HyperText Markup Language) defines the structure of the page, including the menu, buttons, cart, and total amount. The following is the main structure; the complete working file is included in the project ZIP.

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <title>Online Food Order</title>
  <link rel="stylesheet" href="style.css">
</head>
<body>
  <h1>Online Food Order</h1>
  <button onclick="addToCart('Cheese Pizza',150)">+ Add Pizza</button>
  <ul id="cart"></ul>
  <h3 id="total">■0</h3>
  <button onclick="placeOrder()">Place Order</button>
  <script src="script.js"></script>
</body>
</html>
```

CSS

CSS (Cascading Style Sheets) controls colours, spacing, typography, card design, buttons, and responsive layout.

```
body { font-family: Arial, sans-serif; background: #fff8f1; }
.food-card { background: white; border-radius: 18px; }
.add-button, .checkout-button {
  background: #ef6b35; color: white; border: 0;
  padding: 10px 14px; border-radius: 9px; cursor: pointer;
}
```

JavaScript

JavaScript implements the main application logic. It stores cart items, calculates the total, updates the page, and displays the order confirmation. The complete JavaScript file is included in the ZIP folder.

```
const cartItems = [];
function addToCart(name, price) {
  const existing = cartItems.find(item => item.name === name);
  if (existing) existing.quantity += 1;
  else cartItems.push({ name, price, quantity: 1 });
  renderCart();
}
function removeFromCart(name) {
  const index = cartItems.findIndex(item => item.name === name);
  if (index !== -1) cartItems.splice(index, 1);
  renderCart();
}
function renderCart() {
  // Update cart items, item count and total price on the page.
}
function placeOrder() {
  const total = cartItems.reduce((sum, item) => sum + item.price * item.quantity, 0);
  if (total === 0) alert('Please add a food item to your cart first.');
  else alert(`Order placed successfully! Total: ■${total}`);
}
```

4.3 Project Execution

• Save the files index.html, style.css, and script.js in the same folder.

• Open index.html in a modern web browser.

• Choose food items using the + Add buttons.

• Review the shopping cart and total amount.

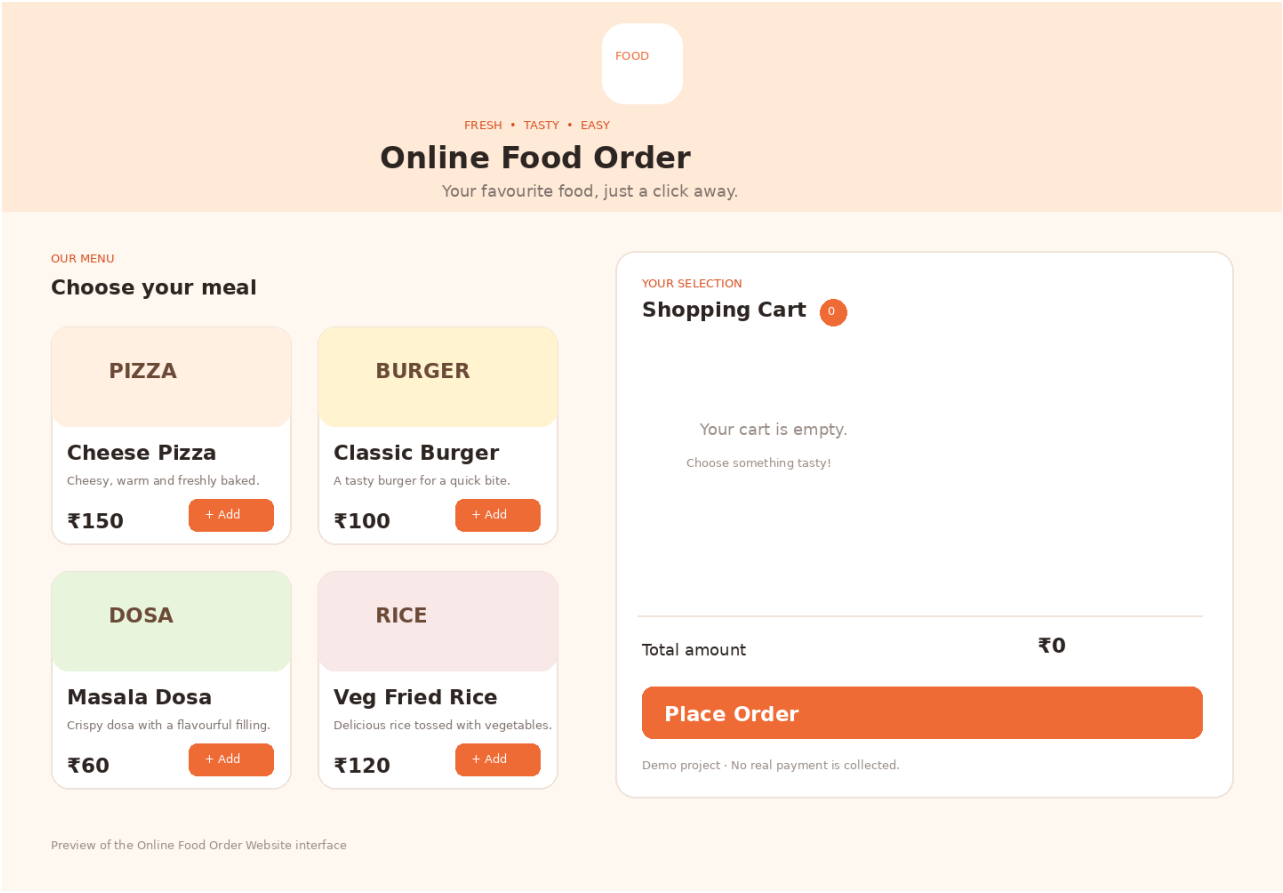

• Remove items if needed, then click Place Order.

• A message confirms the demo order. No real payment or restaurant order is processed.

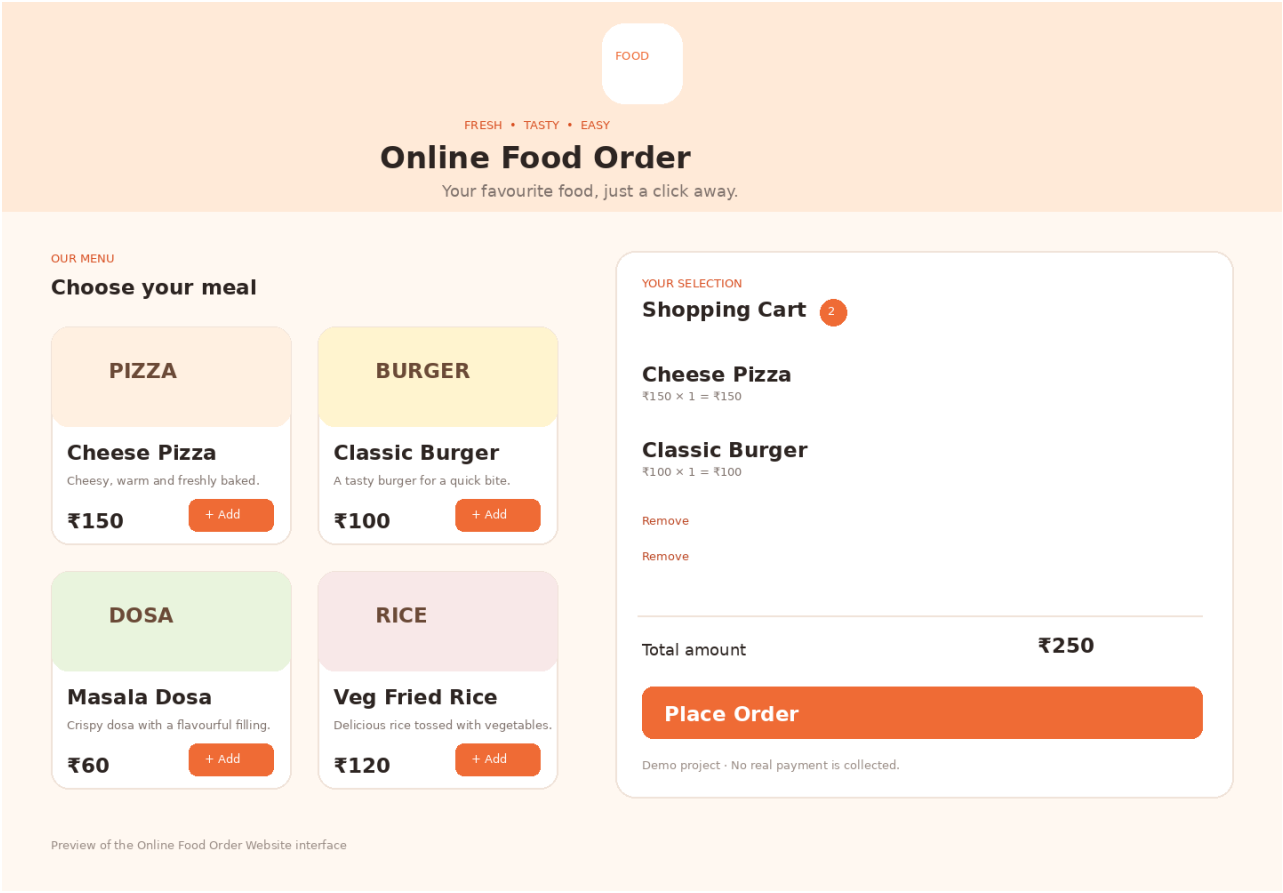

5. Output Screenshots

The following previews show the website interface and a cart containing selected food. These are illustrative previews of the project design.

Screenshot 1: Home page and food menu

Screenshot 2: Cart with selected food items and total

Preview of the Online Food Order Website interface

6. Technical Explanation

HTML: Provides the content and page structure through headings, buttons, lists, and sections.

CSS: Controls colours, fonts, spacing, cards, button appearance, and the responsive layout.

JavaScript: Uses arrays, objects, functions, conditions, and calculations to manage the cart and total amount.

DOM Manipulation: Updates the cart and total in the page without reloading it.

Event Handling: The onclick actions call JavaScript functions when users press buttons.

7. Conclusion

The Online Food Order Website demonstrates how HTML, CSS, and JavaScript can work together to build an interactive website. Users can browse food items, add items to a cart, see the total price, remove items, and receive a demo order confirmation. This project helps develop basic web design and programming skills.

8. Future Enhancements

• Add customer registration and login.

• Add food photographs and a search feature.

• Add category filters and quantity controls.

• Connect the website to a database to store menus and orders.

• Integrate a secure payment gateway.

• Add delivery address, order status, and tracking.

• Improve accessibility and mobile responsiveness.

• Connect orders to a restaurant administration panel.

Project note: This version is a front-end demonstration. A live GitHub repository URL must be added after the files are uploaded to a GitHub account.
